DETAILED ACTION

Specification

1. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-2, 9-10 are rejected under 35 U.S.C. 102(e) as being anticipated by Pettus U.S. Patent 6,360,266.

As per claim 1, Pettus teaches a method of debugging a target system using a host system connected thereto (column 8, lines 28-37), the target system comprising a digital signal processor having associated memory comprising plural addressable locations (column 5, lines 25-38), said target system further having a reserved storage location designated as a vector (column 4, lines 38-44), said memory further storing plural application programs, each application program having respective associated exception handler code (column 4, lines 38-44; column 11, lines 5-11), the method comprising: dynamically loading an stack to said reserved region (column 4, lines 38-44; column 10, lines 36-50); causing the vector of said target system to point to said

Art Unit: 2113

stack whereby all said applications use the said stack for said exception (column 4, lines 42-44; column 11, lines 5-11).

As per claim 2, Pettus teaches the method of claim I further comprising the steps of: dynamically loading a library to said target from said host whereby said dynamically loaded library has an entry point at one of said plural addressable locations, wherein said library includes at least one routine needed for running at least one of said applications; and storing information indicative of the address of said one location at a reserved location in said stack (column 14, lines 3-67).

As per claim 9, Pettus teaches a device for debugging a target system, the device comprising a host system connected thereto (column 8, lines 28-37), the target system comprising a digital signal processor having associated memory comprising plural addressable locations (column 5, lines 25-38), said target system further having a reserved storage location designated as a vector (column 4, lines 38-44), said memory further storing plural application programs, each application program having respective associated exception handler code (column 4, lines 38-44; column 11, lines 5-11), the device further comprising: stack dynamic loading circuitry in said host for dynamically loading a stack to said reserved region, whereby said loader comprises an indication of the location in said memory of said stack (column 4, lines 38-44; column 10, lines 36-50); vector writing circuitry receiving said indication, and writing to said the vector of said target system the address of said stack whereby all said applications use the said stack for said exception (column 4, lines 42-44; column 11, lines 5-11).

As per claim 10, Pettus teaches the device of claim 9 further comprising: a computer file in said host, said file comprising a library having a routine needed by at least one of said

Art Unit: 2113

applications; library dynamic loading circuitry for dynamically loading said library to said target from said host whereby said dynamically loaded library has an entry point at one of said plural addressable locations; and stack writing circuitry for storing information indicative of the address of said one location at a reserved location in said stack (column 14, lines 3-67).

Allowable Subject Matter

4. Claims 3-8, 11-13 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
